

MENDPOINT

Investor one-pager | Warden product | Open-source monorepo | July 2026

Warden is Mendpoint's API integration teammate: graph engineering (specialized verify-backed nodes, not one mega-agent), reviewable migration PRs, and an on-demand API debug loop. Never auto-merges by default. github.com/gondalaimafia/mendpoint | MIT

The problem

Modern software is a mesh of external APIs. Breaking changes, silent field renames, and SDK drift ship constantly. Changelogs go unread; teams discover breakage in production incidents, not pull requests. General coding agents are not built to track vendor change, map blast radius through real call graphs, or ship review-first migration PRs.

The company

Mendpoint is an applied AI company for legacy and integration code migration-Cognition-style (reasoning + agentic systems + FDE delivery), focused on keeping codebases correct as the APIs they depend on keep changing. Warden is the first product.

What we have shipped (evidence, not pitch)

- End-to-end loop: OpenAPI change -> impactable surfaces -> hybrid index/candidates -> call-graph expand -> confirm -> multi-file PR (migrate + adopt).
- GitHub delivery: mock + real Octokit + GitHub App install/runtime path.
- Trust: never auto-merge by default (env hard-gate), path denylist, audit export, severity tiers, notification-only mode.
- Graph engineering orchestrator: change intel -> expand (fan-out) -> generate -> verify -> human review; domain call/e/product graphs.
- Warden agent: on-demand API debug tool-loop; multi-category failure training; internal warden-bench 5/5.
- Quality bars: TS/Python/Go/Java/Ruby harnesses; design-partner fixture eval $\geq 70\%$; vendor examples (Stripe, OpenAI, AWS, ...).
- Pre-customer surfaces: exposure report API, flagship OpenAPI fixtures (Stripe/OpenAI/Twilio/AWS/Plaid), changelog parser, Slack notify, brand packs, dual dashboards + /graph.
- Open source monorepo (MIT) for diligence-20+ packages; reproducible demo: `npm test && npm run demo && npm run eval:warden`.

Why investable now

- Narrow wedge, chronic pain: API change -> customer code (expanding with AI-driven API sprawl).
- Differentiated system, not a chat wrapper: graph impact + graph-engineered agents + policy/trust.
- Shipped depth for diligence: multi-language bars, GitHub App path, agents, open repo.
- FDE-fit GTM: fintech, AI infra, developer tools-white-glove first, then productize.
- Neutral multi-vendor platform; provider-branded packs as a later channel.

Traction stage (honest)

Past pitch deck: yes-runable E2E product. Design partners: path ready (App/token). Continuous multi-vendor watch at scale: partial (OpenAPI poll + fixtures). Public competitive API-SWE-bench: internal only. Enterprise SSO/SOC2/multi-SCM: deferred.

Near-term use of capital

Live flagship feeds | 3-5 design partners | expand internal API-regression bench | multi-service monorepo PR orchestration | cloud sandbox workers | FDE capacity for high-API-density teams.

Ask / diligence

Clone the repo. Run: `npm install && npm test && npm run demo && npm run eval:warden`. Claims policy: only what the monorepo can show (docs/WARDEN_CLAIMS.md). Contact: Mendpoint team | Product: Warden on Mendpoint.
